Practical Examples of Dragnet Solution in Numerical Reasoning

Example 1: Percentage Problem

Question: A shop sold 120 units of a product at a profit of 20%. If the cost price per unit is Rs. 50, what was the total selling price?

Solution Using Dragnet Approach:

Step 1: Understand data: Cost price per unit = Rs. 50 Profit = 20% Units sold = 120

Step 2: Calculate selling price per unit: Profit per unit = 20% of Rs. 50 = $0.20 \times 50 = \text{Rs. } 10$ Selling price per unit = Rs. 50 + Rs. 10 = Rs. 60

Step 3: Calculate total selling price: Total = Rs. 60 $\times$ 120 = Rs. 7200

Final Answer: Rs. 7200

This example demonstrates the systematic breakdown considering profit percentage, unit cost, and total units to arrive at the solution efficiently.

Example 2: Data Interpretation

Question: The following table shows the sales of five products over a month:

Product	Units Sold	Price per Unit (Rs.)
A	150	20
B	200	15
C	100	25
D	180	22
E	120	18

[Find the total revenue generated from all products.]

Solution Using Dragnet Approach:

Step 1: Calculate revenue for each product: Product A: $150 \times 20 = \text{Rs. } 3000$ Product B: $200 \times 15 = \text{Rs. } 3000$ Product C: $100 \times 25 = \text{Rs. } 2500$ Product D: $180 \times 22 = \text{Rs. } 3960$ Product E: $120 \times 18 = \text{Rs. } 2160$

Step 2: Sum all revenues: Rs. 3000 + Rs. 3000 + Rs. 2500 + Rs. 3960 + Rs. 2160 = Rs. 14620

Final Answer: Rs. 14620

By systematically calculating each component, the dragnet solution ensures accuracy and clarity.

Tips to Enhance Numerical Reasoning Using Dragnet Solution

Practice Regularly: Consistent practice helps recognize patterns and improves problem-solving speed.

Develop a Logical Framework: Always follow a structured approach rather than jumping to answers.

Core Concepts of Dragnet Solution Numerical Reasoning To excel in dragnet solutions, candidates must be familiar with foundational mathematical concepts and develop a strategic approach to problem-solving.

Fundamental Mathematical Tools:

- Percentages and percentage increases/decreases**
- Ratios and proportions**
- Averages (mean, median, mode)**
- Time,**

speed, and distance calculations Algebraic expressions and equations Data interpretation from tables and charts

Strategic Approach: Read the problem carefully: Understand what is being asked. Identify relevant data: Highlight key figures and information. Convert data into usable formats: Simplify complex data. Choose an appropriate method: Select formulas or logical steps. Perform calculations systematically: Follow step-by-step procedures. Verify your answer: Check if it makes sense within the context.

Step-by-Step Guide to Dragnet Solution Numerical Reasoning

Let's explore a detailed approach with an example to illustrate how to implement dragnet solutions effectively.

Example Problem: In a company, the number of employees increased by 20% last year. If the current number of employees is 720, what was the number of employees two years ago?

Step 1: Understand the Question You're asked to find the original number of employees two years ago, given the current number and the percentage increase over the last year.

Step 2: Identify Relevant Data Current employees = 720 Percentage increase last year = 20% Time frame: Two years ago

Step 3: Break Down the Problem First, determine the number of employees after the 20% increase last year. Then, understand the growth over the two-year span.

Step 4: Reverse the Percentage Increase Since the current number (720) reflects a 20% increase over the previous year, you can find the number of employees after the first year (i.e., at the end of last year):

$$\text{Employees after 1 year} = \text{Current employees} / (1 + \text{percentage increase})$$

Expressed mathematically: $\text{Employees after 1 year} = 720 / 1.20 = 600$

Step 5: Understand Growth Over Two Years The problem asks for the number of employees two years ago. Assuming the same percentage increase applies each year: Let the number of employees two years ago = x

After one year: $x (1 + 20\%) = x \cdot 1.20$

After two years: $x (1.20)^2$

We know after two years, the number of employees is 600 (from Step 4), so: $x (1.20)^2 = 600$

Step 6: Solve for x Calculate: $x = 600 / (1.20)^2$

$$x = 600 / 1.44 \approx 416.67$$

Answer: Approximately 417 employees were there two years ago.

Tips for Effective Dragnet Solutions in Numerical Reasoning

- None of the above.

Answer: b) Some officers trained in first aid are not trained in firearms. (The statement "Some officers are also trained in firearms" doesn't imply all are, so it's possible some trained in first aid are not trained in firearms.)

Numerical Reasoning Question: A police officer's salary increases by 5% each year. If their current salary is £30,000, what will be their salary after 3 years?

Calculation:

Year 1: $£30,000 + (5\% \text{ of } £30,000) = £30,000 + £1,500 = £31,500$

Year 2: $£31,500 + (5\% \text{ of } £31,500) = £31,500 + £1,575 = £33,075$

Year 3: $£33,075 + (5\% \text{ of } £33,075) = £33,075 + £1,653.75 = £34,728.75$

Answer: Approximately £34,728.75
