- Brake Light Circuit**

When the brake pedal is pressed, a signal activates the brake light circuit. The blue wire transmits power from the brake switch to the brake light bulbs. This circuit runs parallel to the tail light bulbs and is activated only during braking.
- Reverse Light Circuit**

When the vehicle is put into reverse, the reverse switch closes. The white or green wire supplies power to the reverse lights. Reverse lights are typically located at the bottom of the tail light assembly for visibility.
- Running Lights**

These are the constant lights that turn on with the headlights. The same circuit can power both tail and marker lights. The wiring often includes a dedicated line to ensure consistent operation.

Additional Circuits

Some Freightliner models include additional features like: Sealed or LED tail lights with integrated wiring. Backup cameras or sensors integrated into the tail light assembly.
