Detailed Solutions to Selected Exercises

Exercise 1: Classification of Signals

Problem Statement: Determine whether the following signals are energy signals, power signals, or neither:

$$x(t) = e^{-t} u(t) \quad \text{and} \quad x[n] = \frac{1}{n} \quad \text{for } n \geq 1, \text{ zero otherwise}$$

Solution:

Signal 1: $x(t) = e^{-t} u(t)$

Analysis: $u(t)$ is the unit step function. The signal is non-zero only for $t \geq 0$. To determine if it's energy or power, compute the energy:

$$E = \int_{-\infty}^{\infty} |x(t)|^2 dt = \int_0^{\infty} e^{-2t} dt = \left[-\frac{1}{2} e^{-2t} \right]_0^{\infty} = \frac{1}{2}$$

Since E is finite, it is an energy signal.

Power: $P = \lim_{T \rightarrow \infty} \frac{1}{2T} \int_{-T}^T |x(t)|^2 dt = 0$ (since energy is finite and the duration tends to infinity), confirming it is not a power signal.

Signal 2: $x[n] = \frac{1}{n}$ for $n \geq 1$

Energy: $E = \sum_{n=1}^{\infty} |x[n]|^2 = \sum_{n=1}^{\infty} \frac{1}{n^2} = \frac{\pi^2}{6}$ which is finite.

Power: $P = \lim_{N \rightarrow \infty} \frac{1}{2N+1} \sum_{n=-N}^N |x[n]|^2$ but since $x[n] = 0$ for $n < 1$, the sum reduces to:

$$P = \lim_{N \rightarrow \infty} \frac{1}{2N+1} \sum_{n=1}^N \frac{1}{n^2}$$

As $N \rightarrow \infty$, the sum tends to $\pi^2/6$, but dividing by $2N + 1 \rightarrow \infty$: $P = 0$. Thus, energy signal.

Signal 3: $x(t) = \sin(2\pi f_0 t)$ Energy: $E = \int_{-\infty}^{\infty} \sin^2(2\pi f_0 t) dt$ which diverges to infinity, so not an energy signal.

Power: $P = \lim_{T \rightarrow \infty} \frac{1}{2T} \int_{-T/2}^{T/2} \sin^2(2\pi f_0 t) dt = \frac{1}{2}$ since the average value of $\sin^2$ over a period is $1/2$.

Conclusion: Signal 1: Energy signal Signal 2: Energy signal Signal 3: Power signal

Key Concepts and Theorems with Solutions

Fourier Series and Fourier Transform Solutions

Problem: Find the Fourier series coefficients for $x(t) = 1 + 2\cos(2\pi f_0 t)$ over one period $T = 1/f_0$.

Solution: The Fourier series coefficients a_k are given by: $a_k = \frac{1}{T} \int_0^T x(t) e^{-j2\pi k t / T} dt$

For $x(t)$, the constant term and cosine term contribute: $a_0 = \frac{1}{T} \int_0^T x(t) dt = \frac{1}{T} \left[\int_0^T 1 dt + 2 \int_0^T \cos(2\pi f_0 t) dt \right]$

Since: $\int_0^T 1 dt = T$ and $\int_0^T \cos(2\pi f_0 t) dt = 0$ (because cosine completes an integer number of cycles over T). Thus, $a_0 = \frac{1}{T} (T + 0) = 1$

For $k \neq 0$: $a_k = \frac{1}{T} \int_0^T x(t) e^{-j2\pi k t / T} dt = \frac{1}{T} \left[\int_0^T 1 \cdot e^{-j2\pi k t / T} dt + 2 \int_0^T \cos(2\pi f_0 t) e^{-j2\pi k t / T} dt \right]$

The first integral: $\int_0^T e^{-j2\pi k t / T} dt = \left[\frac{e^{-j2\pi k t / T}}{-j2\pi k / T} \right]_0^T = 0$ for $k \neq 0$, because $e^{-j2\pi k} = 1$, so numerator is zero.

The second integral involves Fourier coefficients of cosine, which are non-zero only at $k = \pm 1$. Result: $a_0 = 1$, $a_{\pm 1} = 1$ for all $k \neq \pm 1$

The non-zero Fourier coefficients are: $a_1 = 1$, $a_{-1} = 1$ by similar calculations, confirming the spectral components.

Problem 1: Computing the DTFT of a Given Sequence
Solution Approach: Recognize the form of the sequence. Use known DTFT pairs and properties. For finite sequences, express as a sum and evaluate or use the DFT as an approximation. For infinite sequences, consider convergence and regions of convergence.
Example: Calculate the DTFT of $x[n] = a^n u[n]$, where $|a| < 1$.
Solution: $X(e^{j\omega}) = \sum_{n=0}^{\infty} a^n e^{-j\omega n} = \frac{1}{1 - a e^{-j\omega}}$, $|a| < 1$

Problem 2: Designing Digital Filters Using Z-Transform Techniques
Solution Approach: Specify the desired frequency response. Derive the ideal system function $H(z)$. Factor $H(z)$ into zeros and poles. Use partial fraction expansion if necessary. Implement the filter using difference equations derived from $H(z)$.
Example: Design a low-pass filter with cutoff frequency ω_c .
Solution: Use a windowed sinc function in the time domain. Convert to Z-domain and analyze pole-zero placement. Approximate with stable, causal filters.

Problem 3: Signal Reconstruction from Samples
Solution Approach: Verify the sampling rate satisfies the Nyquist criterion. Use ideal low-pass filtering (sinc interpolation). For practical systems, employ approximate filters.
Example: Reconstruct a bandlimited signal sampled at $2\omega_{\max}$.
Solution: The reconstructed signal $x(t)$ is obtained via convolution with the sinc function: $x(t) = \sum_{n=-\infty}^{\infty} x[n] \operatorname{sinc}\left(\frac{\pi}{T}(t - nT)\right)$ where T is the sampling period.

Overview of Discrete Time Signals and Systems

Before delving into Oppenheim's specific solutions, it's essential to establish a clear understanding of discrete time signals and systems.

What Are Discrete Time Signals? Discrete time signals are sequences of data points indexed by integers, representing samples of a continuous-time signal taken at discrete intervals. Mathematically, a discrete time signal is represented as: $x[n]$ where n is an integer (e.g., $n = 0, 1, 2, \dots$). These signals are foundational in digital signal processing because real-world signals are typically sampled to convert continuous signals into a form suitable for digital computation.

Key Properties of Discrete Time Signals

- Linearity:** The principle that the superposition of signals applies, i.e., the response to a sum of inputs is the sum of responses.
- Shift-Invariance:** The system's response does not change over time shifts.
- Time-Invariance:** The system's characteristics remain constant over time.
- Causality:** The output at a given time depends only on current and past inputs.
- Stability:** Bounded inputs produce bounded outputs.

Understanding these properties is crucial for analyzing and designing systems involving discrete signals.

Discrete Time Systems and Their Analysis

Discrete time systems process input signals to produce outputs, often involving operations like filtering, Fourier analysis, and modulation. Their analysis commonly involves tools like the Z-transform, discrete Fourier transform (DFT), and difference equations.
